

MAXIM™**SUBJECT: EQUALIZING STATIC MIX CARTRIDGES**

1. Inspect caulking gun for plunger alignment
2. Check cartridge for leakage and batch date
3. Cut or break away seal of cartridge and inspect for cured or dried product in the end of the cartridge
4. Install cartridge into caulking gun
5. Gun out small amount of product without the static mix tip to equalize the cartridge
6. Attach the static mix tip and gun out a bead the length of the mixing tip to insure proper color mix. This bead can be used to check cure time
7. Proceed with the repair process
8. Relieve the pressure from the gun
9. Remove cartridge from the caulking gun
10. Leave mixing tip on the cartridge or replace with the cap
11. If the mixing tip is left on the cartridge, store the cartridge inverted (upside down) to reduce contamination or gelling at the front end of the cartridge.
12. Product should be stored in a dry area with moderate humidity at a temperature between 70°F – 80°F (21°C – 27°C). If the product is stored in a colder temperature, it should be brought to room temperature before using.
