

SUBJECT: Epoxy Plastic Repair Products as a Seam Sealer

Evercoat has now approved the use of the epoxy plastic repair products to be used as a seam sealer. This includes the following products; MAXIM #100898, Evercoat #106105, and EDGE #200590

To use the above listed products, apply a 2K urethane or epoxy primer surfacer according to the coating manufacturers' recommendations. Allow the proper cure time as per the coating recommendations, scuff sand the area with P320 to P400 Grit (or a red scuff pad), and then remove the sanding dust with clean compressed air. Re-clean the area with an all-purpose solvent cleaner prior to applying seam sealer to the area.

After reaching the recommended sanding time for the repair products, lightly scuff the seam sealant with P400 or finer (a gray scuff pad may also be used) and top coat. If sanding is required to match an OEM appearance, remove sanding dust with clean compressed air, and apply a primer surfacer according to the coating manufacturers recommendations.
